Kaggle Notebooks is an interactive web-based tool for presenting machine learning code, data, and results. Using notebook-like syntax, Kaggle Notebooks enable you to explore your data, run your machine learning models, and visualize the results.

Notebooks are open source, and anyone can create, edit, and share them. A: Not sure if this is what you are looking for but if you are looking for a visual modelling tool for python you can check out sklearn in jupyter. It is a fantastic visual tool for data mining, as long as you can read some python :) You might also want to check out scikit-learn, which is a package for python. It's very fast and has a number of methods to assist with data exploration. To quote a short answer on the project page Scikit-Learn is a Python machine learning library. It provides a unified interface to a large number of popular machine learning algorithms and is designed to work well with Python's object-oriented programming. Scikit-Learn contains a collection of some of the most widely used machine learning algorithms, as well as a core set of utilities and interfaces that are commonly used by machine learning practitioners. For some examples, see the scikit-learn gallery. The first example in the gallery shows one way to explore the data. Q: How to use 2 different versions of "git clone" using submodules? I'm using a git repo with git submodules. I need to use Git 1.8.2.1 for some stuff, and for other stuff, I need to use Git 1.7.10.5 (more specifically, I need to use the libgit2 0.21.0 release, and since the official 0.21.0 release is for Git 1.7.10.4, I need to use the libgit2 0.20.2 one). The problem is that I can't get both of these versions working on the same repository because Git doesn't like the fact that libgit2 0.20.2 has an incompatible signature for the git\_dir\_new function. I did try to use the deprecated git\_dir\_new\_from\_file\_path, but as the documentation clearly states, this function is for compatibility with git 82157476af
